# Web Security

- Based on cryptography
- SSL / TLS current encryption standards
- HTTPS = HTTP through a SSL tunnel (no changes in JSP required)

# Cryptography

- Mathematical tools for enabling trust
- Based on fundamental assumptions
  - algorithms are safe (there are no shortcuts)
  - parameter space searches for keys takes a long time
  - techniques used as intended
- Message: data
- Algorithm: the encryption method
- Key: encryption key, parameter to encryption algorithm
- Cipher text: the encrypted message

Next Time

# One-Way Encryption

- Messages are encrypted using secret keys
- Messages can not be decrypted
- Cipher texts are (to a high probability) uniquely mapped to message content
- Cipher texts are used instead of messages in situations where messages must be kept secret (e.g., passwords)
- Closely related to hashcodes and Message Authentication Codes (MACs)

# Symmetric Encryption

- Commonly referred to as *private key encryption*
- Messages are encrypted and decrypted using the same key
- Anyone with access to the key can decrypt the message
- Fast
- Suffers from *the key distribution problem*

◀ ▶ ⏪ ⏩ 🔍 🔄

Next Time

## Asymmetric Encryption

- Commonly referred to as *public key encryption*
- Messages are encrypted using key pairs (public & private)
- One key used for encryption, the other for decryption
- Public key distributed as much as possible
- Private key kept secret
- Versatile and more secure than symmetric algorithms
- Slow

Tag Lifecycle

Next Time

## Asymmetric Encryption

- Encrypt message using public key - encryption
- Encrypt message using private key - signatures
- Messages can be both encrypted and signed
- As long as the keys can be trusted
  - messages can be kept secret (only receiver can decrypt)
  - senders and receivers can be authenticated
  - message content can be trusted

## Certificates

- Certificate = signed tuple of public key & identity
- Certificates can be self-signed or signed by others
- Self-signed certificates can be used for encryption (but suffer from *the key distribution problem*)
- Certificates signed by trusted parties can be used for encryption, authentication and message integrity checks

## Public Key Infrastructures (PKI)

- Virtual infrastructures consisting of clients, servers and Certificate Authorities (CA)
- CAs are trusted third parties which provide signed certificates (i.e., signs public keys)
- CA certificates are distributed in browsers and similar tools (trusted and considered known by all)
- Since CA public keys are known, (signed) certificates can be validated offline (without connecting to the CA)
- Secure connections are established between parties using certificates and encryption algorithms
- Network traffic *tunneled* through encrypted channels

## Secure Socket Layer (SSL)

- A protocol for establishing secure connections using certificates and cryptography algorithms
- Transport Level Security (TLS) = SSL v3.0 (almost)
- Clients use server certificate to authenticate server
- Servers use client certificate to authenticate client (optional)
- Once identities have been established, encryption keys are exchanged and symmetric encryption algorithms are used
- SSL clients uses *keystores* to manage certificates and keys

Tag Lifecycle

Next Time

## Keystores

- An encrypted database used to store keys and certificates
- Usually stored in a single file called `.keystore`
- Applications must provide database decryption key (username & password) to access keystore content
- Keystores only containing public keys and certificates are commonly referred to as *truststores*
- Keystores can be shared between SSL applications (usually only done for truststores)

Tag Library Descriptor  
Tag Lifecycle  
Next Time

## HTTPS

- Not an actual protocol
- HTTPS = HTTP through a SSL/TLS tunnel
- The server needs to be provided with a certificate
- If the server is to authenticate clients, the clients need (CA signed) certificates as well
- HTTPS Web servers usually references keystores via configuration (providing filename, username, password)
- Default port 443 (HTTP default port is 80)
- JSP can check if a page was requested via HTTPS using `request.isSecure()`
- HTTPS / SSL is considered safe (today)

## Summary

- Cryptography is the tool for web security
- No changes in JSP required to use HTTPS (web server reconfiguration may be required)
- Web server needs a certificate
- JSP can require clients to use HTTPS

## Tag Libraries

- Introduced in JSP 1.1
- Allows users to create their own JSP tags
- Commonly referred to as *custom tags*
- Emphasizes role-based development methodology (creator of tag different from user of tag)
- Integrated in JSP (can alter JSP body response stream)
- Used to encapsulate complex logic and reuse code

## Custom Tags

- A Java class implementing the *Tag* interface (boilerplate implementation classes available)
- Defines tag name, tag attributes & tag body interpretation
- Specify a tag description in a XML-based *descriptor* file
- Included in JSP using the `taglib` directive
- Tags may control JSP processing

## Tag Interface

- Package `javax.servlet.jsp.tagext`
- Implement directly or extend `TagSupport` / `BodyTagSupport`

```
public interface Tag extends Tag
{
    Tag getParent ();
    void setParent (Tag t);
    void setPageContext (PageContext pc);
    void release ();
    int doEndTag ();
    int doStartTag ();
}
```

Tag Lifecycle  
Next Time

## IterationTag Interface

- Package `javax.servlet.jsp.tagext`
- Implement directly or extend `TagSupport` / `BodyTagSupport`
- Used to iterate body evaluation (repeats until `doAfterBody()` returns `SKIP_BODY`)

```
public interface IterationTag extends Tag
{
    int doAfterBody ();
}
```

◀ ▶ ⏪ ⏩ 🔍 ↻

## BodyTag Interface

- Package `javax.servlet.jsp.tagext`
- Implement directly or extend `BodyTagSupport`
- Used to gain access to body content

```
public interface BodyTag extends IterationTag
{
    int doInitBody ();
    int setBodyContent (BodyContent b);
}
```

## Tag Library Descriptor

- XML-based configuration file
- Provides a mapping from tag names to tag Java classes
- Contains tag library information and tag descriptions
- Tag descriptions direct how the tag is utilized (by the JSP engine, include tag body etc)
- Required, one per tag library

## Descriptor Content

- **name** - tag alias for use in JSP (coupled to tag library namespace)
- **tagclass** - fully qualified implementation class name
- **attribute** - tag attributes (optional)
  - name - attribute name
  - required - attribute required to process tag flag
  - rtexprvalue - attribute value from JSP expression flag
- **info** - descriptive information about tag (optional)
- **body-content** - tag body processing directives (optional)
  - EMPTY - no tag body
  - JSP - body contains JSP
  - TAGDEPENDENT - tag processes body itself

## Tag Lifecycle

- 1 Development
  - coding a tag library & writing a descriptor
  - developing JSP pages that uses the tag library
- 2 Translation - compile time
  - tags and JSP translated to servlets (tag calls inserted)
- 3 Evaluation
  - request time
  - tag is loaded and methods are called

## Tag Development

- Can be done in a separate environment (only requires access to the J2EE environment)
- Tag development like any other Java development
- Tags are exported in a JAR file
- Tag library descriptor included in JAR file (in the META-INF directory)

## Tag Translation

### Compile time

- 1 A call to `doStartTag()` is inserted in Servlet
- 2 Tag body is translated (JSP inserted in Servlet)
- 3 A call to `doEndTag()` is inserted in Servlet

Server-Side Web Development JSP

Today

Web Security Cryptography Public Key Infrastructures HTTPS

Tag Libraries Custom Tags Tag Library Descriptor Tag Lifecycle

Next Time

## Tag Evaluation

Request time

- 1 `setPageContext()` called, page context provided
- 2 `setParent()` called, page hierarchy established (used for nested tags)
- 3 `setAttribute()` is called for attributes
- 4 `doStartTag()` called, return value directs processing
- 5 Tag body processed (if so instructed by `doStartTag()`)
- 6 `doEndTag()` is invoked, return value directs processing
- 7 `release()` is called to release tag resources (so that tag objects can be reused by thread pools)

Server-Side Web Development JSP

Today

Web Security Cryptography Public Key Infrastructures HTTPS

Tag Libraries Custom Tags Tag Library Descriptor Tag Lifecycle

Next Time

## Tag Method Return Values

- `doStartTag()`
  - `EVAL_BODY_INCLUDE` - process tag body
  - `EVAL_BODY_BUFFERED` - tag processes body
  - `SKIP_BODY` - do not process tag body
- `doAfterBody()` (`IterationTag`)
  - `EVAL_BODY_AGAIN` - repeat tag body evaluation
  - `SKIP_BODY` - do not repeat tag body evaluation
- `doEndTag()`
  - `EVAL_PAGE` - process rest of JSP
  - `SKIP_PAGE` - do not process rest of JSP
