## 3 Important Paradigms

- ◆ Functional Orientation
- ◆ Object Orientation
- ◆ Use Case driven Object Orientation

7

## Functional Orientation

- ◆ Focus on *function*: What does the system *do*?
- ◆ The system provides function by using its *abilities*.
- ◆ Abilities can be *decomposed* into finer grained abilities, to an arbitrary level.
- ◆ The *state* of the system *affects* the abilities but is a separate characteristic.
- ◆ Top-down functional decomposition.

## Structured Analysis (SA)

- ◆ Developed 1975/76
  - DeMarco/Yourdon
  - Gane/Sarson
- ◆ System = Process transforming input into output
- ◆ Hierarchical, logical system model
  - Processes
  - Data flows
  - Data stores
  - Terminators
- ◆ Notation:
  - Data flow diagrams (DFDs)
  - Data dictionary (DD)
  - Process specifications (PSpecs)

## Data Flow Diagrams

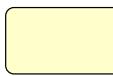

Gane/Sarson

**Terminator:**  
Source or destination of data/information.  
Outside the system boundaries.

**Data flow:**  
Flow of data.

**Process:**  
Transforms input data flow(s)  
into output data flow(s).

**Data store:**  
Data repository.

11

## DFD Development

- ◆ Start with a *context diagram*
- ◆ Successively refine processes
- ◆ Describe all data in the data dictionary
- ◆ Describe all atomic processes by PSpecs
- ◆ Example: Order processing

13

## PSpecs and DD

- ◆ The format of PSpecs is not restricted
  - ❑ Free text
  - ❑ Pseudocode
- ◆ PSpecs must be defined for all atomic processes
- ◆ The format of the DD is semi-formal
- ◆ Example:

```

telephone number = [ local extension | outside number ] ← selection (or)
local extension = 2 + { number }3
outside number = 0 + [ local number | long distance number ] ← composition (and)
local number = prefix * access number
long distance number = (1) + area code + local number ← optional
prefix = [ 123 | 124 | 125 ]
access number = { number }4 ← repetition
number = * any number between 0 and 9 * ← a comment

```

  - ❑ Good communication medium
  - ❑ Supports consistency checks
- ◆ Disadvantages
  - ❑ Not well defined
  - ❑ No common guidelines
  - ❑ Many dialects
  - ❑ Incomplete

15

## SA/RT

- ◆ Extension of SA to describe control flow
  - ❑ Activation/deactivation of processes
  - ❑ Modelling of events (signals)
  - ❑ States and state transitions

- ◆ Additional notation (by Hatley/Pirbhai)
  - ❑ Control flow diagrams (CFDs) — Extended DFDs
  - ❑ Process activation tables (PATs)
  - ❑ State-transition diagrams (STDs)

Idea: Each DFD contains one central control process that consumes and produces all control flows.
