## Texture mapping

? Adding detail to polygon by using a image and mapping it onto the geometry
? Array of color values [RGBA]

## Texturing

? After shading and rasterization we have

- Per-pixel color value (fragment color) RGBA
- Per-pixel depth value: z
? Given a texture, what to do with it?
- We need to know which part of the texture that corresponds to the pixel. We need a mapping
- Also, we need to know the average texture color contributing to the pixel. We need texture filtering.

## Parametric Texture Mapping

Texture size and orientation are tied to the polygon

- Separate texture space and screen space
- Deform (render) the textured polygon into screen space

## Texture space uv

A texture lives in its own image coordinates, parameterized by $(u, v) u ?[0,1]$ and $v ?[0,1]$
If an image has the size $w * h$, then each texel is of size $(1 / w, 1 / h)$ in the $u v$ space.
? The texel value (RGBA(should locate at the center of the texel)
$w$ and $h$ is usually powers of 2 for ease of computation.

## Texture mapping

? Textures can be wrapped around many different surfaces

## Pixel to Texture space

? From a given pixel, which texel should end up on a surface?

Mapping a sphere

- F , lattitude $=\arctan 2(\mathrm{z} / \mathrm{x}, \mathrm{z})$
- $T$, longitude $=\arccos (y)$

## Mapping to a triangle

? Assume each vertex has a texture coordinate associated to it.
? Given a point on the triangle, how do we know what texel to apply to that point?
? We need to calculate the "interpolated" texture coordinate.

We can do this by using the Barycentric coordinate

We have $\mathrm{P}, \mathrm{P}_{1}, \mathrm{P}_{2}, \mathrm{P}_{3}$ and $\mathrm{Tc}_{1}, \mathrm{Tc}_{2}, \mathrm{Tc}_{3}$, We need $\mathrm{Tc}_{\mathrm{x}}$

## Barycentric coordinates

? Given a line defined by $p_{1}$ and $p_{2}$
? Find: a point P on the line:
2. Solution: $\mathbf{p}=(1-t) \mathbf{p}_{1}+t \mathbf{p}_{2}$
? (1-t) and $t$ is the barycentric coordinates, t might range $[-8,8]$, in the interval $t ?[0,1]$ we trace the line between $\mathrm{p}_{1}$ and $\mathrm{p}_{2}$
? For the barycentric coordinates $u$, $v$ the following holds: $u+v=1$ (which we can see above!)
? How does this work for a triangle?
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Barycentric coordinates

- For a triangle we have 3 points:
- $\mathbf{p}=u \mathbf{p}_{1}+v \mathbf{p}_{2}+w \mathbf{p}_{3}$, where $u+v+w=1$.
- $[u, v, w]$ are the barycentric coordinates
- We could also write:
$-\mathbf{p}=u \mathbf{p}_{1}+v \mathbf{p}_{2}+(1-u-v) \mathbf{p}_{3}$. (1)
- (1) is a linear system: $\left.\quad\left[\begin{array}{lll}p_{1} & p_{2} & p_{3}\end{array}\right] \begin{array}{l}u \\ v \\ w\end{array}\right]=p$

## Barycentric coordinate

- Now using cramers rule (checkout Mathworld!) give us the following determinants:

$$
\begin{aligned}
& D=\left|\begin{array}{lll}
p_{1} & p_{2} & p_{3}
\end{array}\right| \\
& A_{1}=\left|\begin{array}{lll}
p & p_{2} & p_{3}
\end{array}\right| \\
& A_{2}=\left|\begin{array}{lll}
p_{1} & p & p_{3}
\end{array}\right| \\
& A_{3}=\left|\begin{array}{lll}
p_{1} & p_{2} & p
\end{array}\right|
\end{aligned}
$$

- And finally: $\left[u=\frac{A_{1}}{D}, v=\frac{A_{2}}{D}, w=\frac{A_{3}}{D}\right]$
- Remember w=1-u-v, so we can save some calculations here.

## Mapping a triangle

- Now, we wanted the texture coordinate at position p .

$$
T c_{p}=u T c_{1}+v T c_{2}+w T c_{3}
$$

## Filtering

? What do we do when a texture sample lands between texel centers, undersampling.
? GL_NEAREST - Pick the closest one
? GL_LINEAR - Interpolate between the four $\qquad$ closest, a BILINEAR approach.

## Mip Mapping

$\qquad$
$\qquad$
$\qquad$
To reduce the high frequency
Introduced by Lance Williams, 1983
MIP = "multumin parvo"-"many things in a small place" $\qquad$
Pre-process input textures by prefiltering it at multiple resolutions
From the change in $\mathrm{u} / \mathrm{v}$ (du, dv) we can pick a corresponding mip-level, and sample a texel from that level. $\qquad$
Linear interpolate between the two nearest level
Supported by OpenGL $\qquad$

## Bump mapping

? Plain textures doesnt model rough surfaces well
$\qquad$
Illumination is still calculated on the underlying flat textured polygon $\qquad$
What if we could model the illumination on the flag polygon using a texture?
? The bump texture is treated as a height function
? We calculate the partial derivatives and model the pixel normal using that. That would make the lighting effect such as if the surface were rough...
, Example?

## Bump mapping

? Since only the normals of the surface is altered, the siluette is not affected.
